

ZOMATO

UX EVALUATION REPORT

Food Ordering & Checkout Flow

Document Type	UX Evaluation & Redesign Recommendation (Internal Assignment)
Product	Zomato — Android Application
Selected Flow	Food Ordering to Checkout (End-to-End)
Version	19.4.7

This document presents a structured UX evaluation of Zomato's food ordering and checkout experience. The analysis is grounded in Nielsen's 10 Usability Heuristics, supported by established UX laws, and concludes with actionable design recommendations. All findings are based on observed interaction patterns in the live application.

01 Product Overview & User Flow App context, flow map, and why this flow matters	02 Annotated Screen Experience 5 key screens with UX issues annotated in-context
03 Usability Issues & Heuristic Mapping 5 issues mapped to Nielsen's heuristics with severity	04 UX Laws Analysis Hick's Law, Fitts's Law, Jakob's Law applied
05 Redesign Recommendations Prioritised, actionable fixes for each identified issue	

01 Product Overview & Selected User Flow

About Zomato Zomato is one of India's largest food delivery and restaurant discovery platforms, with over 100 million users and operations across 500+ cities. The app serves as the primary interface for millions of daily food ordering sessions, making the checkout flow one of the highest-traffic, highest-stakes experiences in the product. The food ordering checkout flow is evaluated here because it is where the majority of drop-offs occur and where friction most directly translates to lost revenue and user trust.	Key Product Stats 100M+ Monthly Active Users 500+ Cities Served 3–5 min Avg. checkout session ~25% Cart abandonment at checkout
---	--

Selected Flow: Food Ordering to Payment Confirmation

The selected flow covers the complete ordering journey from browsing a restaurant menu to receiving order confirmation. This is a 5-step funnel evaluated across 5 screens.

01 Restaurant Menu	02 Cart Order Review	03 Delivery Address Address	04 Payment Selection	05 Order Confirmation
---	---	--	---	--

Why This Flow?

High Business Impact The checkout flow is directly tied to revenue. Any friction here has an immediate, measurable effect on conversion rates.	Highest Drop-Off Zone Cart abandonment is highest between address selection and payment — making it the most critical stage for UX improvement.	Rich Heuristic Opportunities Covers a variety of UX concerns: information architecture, error handling, trust signals, cognitive load, and visual hierarchy.
--	---	--

02 Annotated Screen Experience

The five screens below represent wireframe-level representations of Zomato's current UI, with UX issues annotated in context. Each screen is reproduced from direct interaction with the live application.

Screen 1 — Restaurant Menu Page

UX Issues Identified
Issue 1: 30+ menu items with no visual hierarchy or prominence given to bestsellers
Issue 2: Unnecessary extra clicks on Veg toggle switch
Issue 3: No clear CTA prominence — 'View Cart' blends with background on light themes

Screen 2 — Cart & Order Review

	UX Issues Identified Issue 1: No best coupons are pre-applied-missed savings, user frustration Issue 2: Cart quantities use tiny tap targets (- / +) — violates Fitts's Law Issue 3: Cart sharing option not discoverable-lack of visibility of system status
--	---

Screen 3 — Delivery Address Selection

	UX Issues Identified Issue 1: No visual indicator for which address is currently selected — lack of visibility of system status Issue 2: Delivery estimate hidden/not discoverable until after confirmation; should be shown inline per address - lack of visibility of system status
	

Screen 4 — Payment Selection

	UX Issues Identified Issue 1: No option to enter UPI ID manually Issue 2: Zomato Credits available but NOT auto-applied — missed savings, user frustration Issue 3: No confirmation screen before 'Place Order' — single tap triggers irreversible action Issue 4: Pay on Delivery buried at the bottom; important option is de-prioritised
--	--

Screen 5 — Order Confirmation

	UX Issues Identified Issue 1: Order status steps are all the same visual weight; active step not clearly highlighted Issue 2: Support link is tiny and easily missed — violates error recovery and help heuristic Issue 3: No countdown timer shown; static '32 min' estimate builds no sense of progress
--	--

03 Usability Issues — Heuristic Evaluation

Five usability issues were identified using Nielsen's 10 Usability Heuristics. Each issue is rated on a 4-point severity scale: Critical, High, Medium, or Low.

 CRITICAL — Blocks task completion	 HIGH — Significant friction	 MEDIUM — Causes confusion	 LOW — Minor inconvenience
--	--	--	--

#	Issue Observed	Screen / Location	Heuristic Violated	Severity	How to Improve
1	30+ menu items displayed with no bestseller callouts, no visual ranking, and no content grouping to reduce cognitive load.	Restaurant Menu	Aesthetic & Minimalist Design	Critical	Surface top 3 bestsellers with a badge. Collapse secondary sections. Use progressive disclosure.
2	No option to add UPI ID manually	Payment Page	Hick's Law / User Control	Critical	Add a section to enter UPI ID manually
3	Cart item +/- quantity buttons are visually small, offering a tap target below the minimum recommended touch size of 44x44px.	Cart Page	Flexibility & Efficiency (Fitts's Law)	High	Increase tap target to 44px minimum. Use larger, well-separated +/- controls with clear visual borders.
4	Selected delivery address has no active state indicator — no checkmark, highlight, or selection ring — making current selection ambiguous.	Address Page	Visibility of System Status	High	Add a red border ring, checkmark icon, and filled background tint to the currently selected address card.
5	Zomato Credits (₹50 available) are shown in the payment list but not auto-applied — the user must manually locate and apply them.	Payment Page	Error Prevention / Efficiency	Medium	Auto-apply available credits at checkout. Show a dismissable banner: 'We've applied ₹50 Zomato Credits.' Allow manual removal.

04 UX Laws Analysis

Three foundational UX laws are mapped to specific issues in Zomato's checkout flow below.

UX Law	Definition	Where It Applies in Zomato	Design Fix
Hick's Law	Decision time increases logarithmically with the number of choices presented simultaneously.	Payment screen presents 3 UPI options + Net Banking + 2 Wallets + Cash at the bottom and no option to enter the UPI ID manually simultaneously, overwhelming the user at the most critical drop-off point in the funnel.	Collapse to 1 primary option (last used). Group the rest under 'More payment methods'. Reduce visible choices to 2–3 at any time. Add separate section to enter UPI ID manually
Fitts's Law	The time to reach a target is a function of the target's size and the distance to it. Small, distant targets are harder to tap accurately.	Cart page +/- quantity controls are rendered as small icon buttons without adequate spacing. They are often misregistered, causing accidental taps on adjacent elements.	Increase all interactive button sizes to a minimum of 44×44px (Apple HIG / Material Design standard). Increase inter-button spacing to prevent accidental taps.
Jakob's Law	Users spend most of their time on other apps; they prefer interfaces that work the same way as those they already know.	Zomato's address confirmation requires a visible status for the selected current address	Provide a light confirmation via a tick animation rather than grouping it in Current/Other addresses.

05 Redesign Recommendations

The following recommendations are prioritised by severity and potential conversion impact. Each recommendation is directly tied to an identified usability issue and supported by a specific heuristic or UX law.

Restructure Menu with Progressive Disclosure & Bestseller Hierarchy

Current Problem: The current menu lists all items in flat, equal-weight sections. Users must scroll through 30+ items with no indication of what is popular, highly rated, or relevant to their context.

R1 Recommended Fix: Introduce a sticky 'Top Picks' section at the top with the restaurant's 3 bestsellers (badge + extra-large card format). Use expandable category sections by default — collapsed to 3 items each with a 'See all' affordance. Add a veg/non-veg quick filter toggle at the top of the menu.

Expected Impact: Estimated 15–20% improvement in item selection speed; reduction in scroll depth; higher add-to-cart rate.

Before

After

Implement Smart Payment Default with Collapsed Options

Current Problem: The payment screen shows all available methods simultaneously, creating excessive cognitive load right before the final conversion step — the point with the highest abandonment risk.

R2 Recommended Fix: On page load, show only the last-used payment method as a pre-selected primary option with a '1-tap pay' CTA. Group all other methods in a collapsible 'Pay another way' section. Auto-apply Zomato Credits/wallet balance with a visible deduction summary. Add a short trust line: 'Secured by 256-bit encryption.'

Expected Impact: Estimated 10–18% increase in payment completion rate. Reduction in payment page dwell time.

Before

After

R3

Add Active Selection State to Address Cards

Current Problem: After tapping an address, there is no visual confirmation that it has been selected. The lack of system feedback violates Nielsen's first heuristic and creates uncertainty.

Recommended Fix: Apply a clearly visible active state to the selected address card: a 2px red border ring, a filled checkmark icon top-right, and a light red tint background. Remove the separate 'Confirm' button and auto-confirm on tap, consistent with the dominant pattern established by Swiggy and Amazon (Jakob's Law).

Expected Impact: Reduced user hesitation at address step; lower back-navigation rate; cleaner funnel progression.

Before

After

Increase Cart Quantity Button Tap Targets

R4

Current Problem: The +/- quantity controls in the cart are too small at ~28–32px. Accidental taps change quantities unintentionally, causing user frustration and incorrect orders — especially common on sub-6-inch Android screens.

Recommended Fix: Expand both buttons to minimum 44×44px as per Material Design guidelines. Add a visible border and 16px minimum gap between – and + to prevent mis-taps. Consider using a quantity input field for values above 3 to reduce repeated tapping.

Expected Impact: Reduction in accidental quantity changes, improved cart accuracy, faster checkout progression.

Before

After

R5

Auto-Apply Zomato Credits at Checkout

Problem: Zomato Credits are displayed in the payment options list but are not automatically deducted from the bill total. Users must locate, recognise, and manually select the credits option. Most users miss this entirely — a frequent complaint in app reviews.

Fix: Auto-apply any available Zomato Credits to the order total before the payment screen is shown. Display a non-blocking green toast at the top: 'We applied ₹50 Zomato Credits to your order.' Allow removal via a clearly labelled toggle. Show the deducted amount in the bill breakdown.

Expected Impact: Higher perceived value, reduction in missed-savings complaints, improved payment conversion rate.

Before

After

Summary: Priority Matrix

Rec	Recommendation	Heuristic / Law	Screen	Priority
R1	Bestseller hierarchy + progressive disclosure	Aesthetic & Minimalist Design	Restaurant Menu	Critical
R2	Smart payment default + auto-credits	Hick's Law + Efficiency	Payment Page	Critical
R3	Active address state + single-tap confirm	Visibility of Status + Jakob's Law	Address Page	High
R4	Increase cart quantity button tap targets	Flexibility & Efficiency	Cart	Critical
R5	Auto-Apply zomato credits at Checkout	Error Prevention	Payment Page	High
